

Noe Adrian

GitHub: <https://github.com/acuscorp>

Summary:

- **8 years** of experience in Software development, +4 yoe working with **Android Frameworks (Android, Java & Kotlin)**
- **Fully conversant with OOPs principles**, software development frameworks and mobile-targeted
- Experience with implementation of **Android Life Cycle, Fragments, Intents, and threads on Android; binding services**,
- Experience with implementation of Google Maps API in Android and **IOS** for geo-location and maps.
- Experience working with **Android Studio, Eclipse IDE, Visual Studio Code**.
- Experience in creating logins and embedded tweets using the Twitter API, Google and Facebook.
- Familiarized with testing and TDD using the latest tools such as **JUnit, Mockito, Espresso**.
- Experience in **MVC, MVP, VIPER** and **MVVM** architectural design patterns.
- Experience in database management systems such as **MySQL, Realm, MongoDB and SQLite**.
- Experience in working with an internal QA team on system, performance, and acceptance testing.
- Experience with **Android app development life cycle** including Google Play compliance policies and submissions requirements.
- Experience developing mobile to cloud and mobile to embedded device software.
- Experience with Android performance tuning and crash reporting applications.
- Implicit and explicit Intents, background processes, sync adapters, activities for Results, WebView, ViewModel, RecyclerView, RecyclerViewAdapter, Databinding, Custom Widgets.
- **Follow best practices for requirement gathering, design documentation, code review, testing, and defect fixing.**
- **Experience with third party APIs** and web services like Picasso, Facebook, Twitter.
- Worked in multicultural **Agile/Scrum** development environments on Android development teams with both local and remote team members.
- **Worked in small and large agile teams** to design, prototype, and build our product offering and tools.
- Experience in architecting and developing networking and secure applications for Android.
- Continuously made research, test, and implement new techniques, frameworks, and utilities.
- Mentored Junior Developers to fulfill goals and have a constant development growth.
- Extensive experience working with Web Services design and consumption with a **RESTful** architecture.
- Hands-on involvement in all phases of the software-development cycle, including requirement gathering and design
- Strong Understanding of **Activities, Fragments, Custom Views, Services**, Support library, and other 3rd party libraries.
- Ability to independently set tasks and complete work for yourself and your team with limited direction.
- Willingness to spend time testing minute details, especially with user interaction points.

Firmware:

- Analyze, design, develop firmware UI/software applications using C/C++, C#, ARM assembly, Eclipse, Visual Studio, MPLAB, MatLab and LabView.
- Develop applications in several microcontrollers with Atmel, Texas instruments and Microchip.
- Heritage, polymorphism, abstract classes, interface, static, pointers, interruptions.
- Instrumentation and control knowledge applied in digital signal processing.
- VHDL programing language using a spartan FPGA
- Code, debug, test, troubleshoot, maintain existing applications.
- Protocols such as I2C, SPI, UART, TCP, FTP.

Technical Skills:

- **Programming Languages:** Java, Kotlin, Javascript, C++, C and C#
- **Frameworks:** Picasso, Glide, GSON, Dagger2, Retrofit
- **Mobile Apps:** Android in Java and Kotlin
- **Databases:** MySQL, MongoDB, SQLite, Realm
- **Third party tools:** Crashlytics, Google Maps, Facebook, Firebase.
- **Version control:** BitBucket, Gitlab, GitHub, Perforce
- **Quality assurance:** Junit, Espresso, Mockito
- **Operating Systems:** Windows, Linux

- **GUI Tools:** NetBeans, Sublime Text 3, Android Studio, Eclipse, Arduino, Visual Studio, Dev-C++, Code Composer Studio v7, Visual Studio Code. MatLab.
- **Project Tracking:** JIRA, Trello.
- **DBMS:** SQLite, SQL Server, MySQL, Firebird 3, Hibernate HQL.
- **PaaS:** Docker.
- **CI and QA Environments:** Jenkins, SonarQube.
- **Design Patterns and architectures:** MVVM, MVC, Composition, Observer, Singleton, Decorator, Proxy, Command, Abstract factory, Proxy, Dependency Injection.
- **Clean code principles:** Use of SOLID and object-oriented principles.
- **Hardware:** Microcontrollers and boards (Texas Instruments, PIC, Arduino and Raspberry PI), sensors (Gas, Temperature, Humidity, Pressure, Presence, Light, Analogic), DC Motors, Step Motors, Relays. DSP,FPGA and PLCs

Education:

- **Master's.** in Electronics Engineering – Instituto Tecnológico de Morelia Dec 2017 (**Project:** Detection of errors in the transmission line compensated by TCSC)
- Bachelor's in Electronics Engineer - Instituto Tecnológico de Estudios Superiores de Zamora Mar 2011

Professional Experience:

Senior Android developer

Dec 2020 to Present

Solera Company

Project Description: It's about fleet management extracting information from vehicles and saving, processing and showing data to the customers. All the apps are for custom devices

I've been working on Java and C++ legacy code for custom devices with Android OS.

Responsibilities:

- Maintain the app to fix any defect or bug detected and prevent possible new ones to improve the quality of the product (**Java**).
- Refactor legacy code, working with SonarLint and Jenkins
- Be a part of the different Scrum ceremonies such as stand up (daily meeting), sprint planning, retrospective, scrum grooming - Develop new features requested for the project owner using **JIRA, TEAMS, PERFORCE**
- Be a part of the different Scrum ceremonies such as stand up (daily meeting), sprint planning, retrospective, scrum grooming - Develop new features requested for the project owner using **JIRA Confluence**.
- Develop new UI and set the proper UI instrumentation Tests
- Tested android components by **Robolectric** Framework
- Develop new modules following current architectural guidelines
- Used **perforce** for version control, creating proper branch for current work
- Created Pull Request using perforce, code-reviewing and unit testing to ensure code quality
- Reviewed legacy modules and make some test to ensure proper functionality with interactions with new modules
- In-charge of defects and crashes detected for QA or reported by user and fix it to improve the quality of the app
- Write test cases where they are missing. There are no test cases for some old classes in the project
- Reviewed current UI and update it to new design lines

Environment: Java, Jira, Confluence, Android Studio, Scrum, Mockito, PowerMock, Robolectric, Teams and Perforce.

Senior Android Developer

Jun2020 to Dec2020

Yonusa

URL: <https://www.yonusa.com>

https://play.google.com/store/apps/details?id=com.switchupp.yonusa&hl=es_MX

https://play.google.com/store/apps/details?id=com.yonusa.panic&hl=es_MX

Project description:

Fix and maintain his main application named Yonusa and implement new features. Develop a new application in kotlin language, implementing MVVM architecture working in with an OS team to get the same characteristics and app behavior.

Responsibilities:

- I was manager of the software engineering department
- Worked with Agile methodology implementing **SCRUM**,
- Implemented one to many notifications for alerts, using MQTT protocol
- Developed a module with **firebase** that can use **Android Push notifications** also **Firebase analytics**
- Used retrofit to make request to the DBs.
- Custom login and Google, Facebook API to login process
- Implemented UI for panic app working with a UX engineer for better quality
- Developed unit tests with **Mockito** and **Espresso**
- Find and fixed code smells and bugs
- Used **GIT** for version control and **slack** for communication with the team
- Worked with **styles**, **transitions** and **animations** for user experience.
- Work with **MVVM** and **MVC** architecture implementing design patterns and especially compound pattern **Android Jetpack navigation**, **Live Data**, **Room** and **coroutines**.
- Investigated new technologies and propose those that could improve the application

Environment: Kotlin, GitHub, Jira, Confluence, Android Studio, Scrum, Retrofit, Firebase, MQTT, Slack, Firebase Cloud Messaging, MQTT protocol.

Android Developer

Mar2019 to Jun2020

Sistema BEA

URL: <https://bea.com.mx/>

Project description:

Develop the GPS implementation in order to use the onboard GPS chip and the GPS data coming from google service.

Responsibilities:

- Created applications for bus route management.
- Developed applications for internal use to improve engineering processes.
- Elaborated UI and **Unit tests**
- Handled **GSP** data with **google** and the local **hardware GPS** installed in the Devices
- Developed **custom view components**
- Worked with **Maps SDK** for android
- Configured **serial communication** of custom android devices
- Worked with **ADB** commands

Environment: GitHub, Jira, Confluence, slack, Android Studio, Scrum, Retrofit, Firebase Cloud Messaging, MQTT protocol, Google maps, GPS

Android Developer

Jan2017 to Mar2019

Mouser Electronics

URL: <https://www.mouser.mx/>

Responsibilities:

- Developed desktop applications in order to get a better performance and speed up any process
- Helped to fix bugs and implement new features for local apps.
- Implemented new requirements and created documentations for web apps.
- Fix bugs in logical domain for android apps (Java) and web (JS)
- Manage local DB (SQL) of customers in Mexico
- Generate documentation and API testing
- Added new functionality in specific modules.

Environment: GitHub, Jira, Confluence, slack, Android Studio, volley, postman, MySQL

Project: Wocom-Labs

Responsibilities:

- Contributed to the architecture and design of the data acquisition modules of a PLC and a windows application.
- Developed an application to automate process plants irrigation.
- Created scheduler to turn on/off water pump to supply the fertilizer in different areas of the yard

- Code refactor and Implemented new features required for clients
- Participated in the analysis, testing and code reviews
- Worked with Web Services design and consumption with a RESTful architecture.
- Involved in all phases of the software-development cycle, including requirement gathering, design,
- Mentored Junior Developers to fulfill goals and have a constant development growth.

Environment: GitHub, Jira, Confluence, slack, Android Studio, Scrum, Retrofit

Teacher in Biomedical Engineering
Instituto Tecnológico Superior Purhepecha
URL: <https://its-purhepecha.edu.mx/>

Jan2016 to Jan2017

Responsibilities:

- Teach Object Oriented Programming
- Software Engineering fundamentals
- Software engineer
- Maths and physics
- Topics such as sensing and instrumentation.

Electronics Engineer

Jun2014 to Dec2015

AquaFim

URL: <https://aquafim.com/>

Responsibilities:

- Created the firmware for Microcontrollers to handle the irrigation schedules turning on and off actuator and measure sensors as PH and TDS, also some humidity and heat sensor.
- Set up software to handle irrigation.
- Automation irrigation system
- Worked serial communication and worked with microcontrollers msp-430, Arduino and some of PIC family
- Programmed in C/C++
- Electrical connections, Worked with radio Frequency
- Worked with sensors for humidity, Ph, light.

Environment: GitHub, Visual Studio Code Arduino IDE

Electronics Engineer
Arneses Electricos Automotrices
URL <https://www.condumex.com.mx/>

Jan2013 to Jun2014

Responsibilities:

- Configure new implementations and fix issues regarding Bluetooth connection and audio filtering system. Participated in daily meetings and collaborate with new employees
- Understand and created improvements to get a better pairing connection with the Bluetooth module
- Created different kinds of filters implementing FFT in hardware using an FPGA and communicating with a DSP500 which is special to handle audio signals and make signal audio processing.

Telecommunication Engineer

Apr2012 to Dec2012

Ericsson

URL: <https://www.ericsson.com/>

Responsibilities:

- Provided technical service and support to the customers.
- Troubleshoot and resolve problems to stabilize and optimize customer networks.
- Configure and integrate different nodes and solutions in new and live customer networks.
- Monitor, control and configured radio bases for satellite communications that implement internet 2G and 3G.
- Provided support to the call center incase of an interruption of the services provided from Ericsson.
- Handled customer issues, dedicated support and Software Update Management (SUM)
- Mentored Remote Service Gateway (RSG)
